

Combinatorial Dyson-Schwinger equations and systems III systems of Dyson-Schwinger equations

Loïc Foissy

Potsdam
November 2013

Let I be a set. Rooted trees decorated by I :

$$\bullet_a, a \in I; \quad \mathfrak{!}_a^b, (a, b) \in I^2; \quad {}^b\mathbb{V}_a^c = {}^c\mathbb{V}_a^b, \mathfrak{!}_a^c, (a, b, c) \in I^3;$$

$${}^b\mathbb{V}_a^c = {}^d\mathbb{V}_a^c = \dots = {}^d\mathbb{V}_a^c, {}^c\mathbb{V}_a^d = {}^d\mathbb{V}_a^c, {}^c\mathbb{V}_a^d = {}^d\mathbb{V}_a^c, \mathfrak{!}_a^d, (a, b, c, d) \in I^4.$$

Coproduct:

$$\begin{aligned} \Delta({}^b\mathbb{V}_d^c) &= {}^a\mathbb{V}_d^c \otimes \mathbf{1} + \mathbf{1} \otimes {}^a\mathbb{V}_d^c + \mathfrak{!}_b^a \otimes \mathfrak{!}_d^c + \bullet_a \otimes {}^b\mathbb{V}_d^c \\ &+ \bullet_c \otimes \mathfrak{!}_d^a + \mathfrak{!}_b^a \bullet_c \otimes \bullet_d + \bullet_a \bullet_c \otimes \mathfrak{!}_d^b. \end{aligned}$$

Dyson-Schwinger system from QED:

$$\text{wavy line with vertex} = \sum_{\gamma} B_{\gamma} \left(\frac{(1 + \text{wavy line with vertex})^{1+2|\gamma|}}{(1 - \text{fermion line})^{2|\gamma|} (1 - \text{wavy line})^{|\gamma|}} \right),$$

$$\text{wavy line} = B \left(\frac{(1 + \text{wavy line with vertex})^2}{(1 - \text{fermion line})^2} \right),$$

$$\text{fermion line} = B \left(\frac{(1 + \text{wavy line with vertex})^2}{(1 - \text{fermion line})(1 - \text{wavy line})} \right).$$

Dyson-Schwinger system from QED:

$$\text{Diagram 1} = \sum_{n=1}^{\infty} \left(\sum_{|\gamma|=n} B_{\gamma} \right) \left(\frac{(1 + \text{Diagram 1})^{1+2n}}{(1 - \text{Diagram 2})^{2n} (1 - \text{Diagram 3})^n} \right),$$

$$\text{Diagram 3} = B \text{Diagram 4} \left(\frac{(1 + \text{Diagram 1})^2}{(1 - \text{Diagram 2})^2} \right),$$

$$\text{Diagram 2} = B \text{Diagram 5} \left(\frac{(1 + \text{Diagram 1})^2}{(1 - \text{Diagram 2})(1 - \text{Diagram 3})} \right).$$

Dyson-Schwinger system from QED truncated at order 1:

$$\text{Diagram 1} = B \left(\frac{(1 + \text{Diagram 1})^3}{(1 - \text{Diagram 2})^2 (1 - \text{Diagram 3})} \right),$$

$$\text{Diagram 3} = B \left(\frac{(1 + \text{Diagram 1})^2}{(1 - \text{Diagram 2})^2} \right),$$

$$\text{Diagram 2} = B \left(\frac{(1 + \text{Diagram 1})^2}{(1 - \text{Diagram 2}) (1 - \text{Diagram 3})} \right).$$

Lifting to decorated trees:

$$X_1 = B_1 \left(\frac{(1 + X_1)^3}{(1 - X_3)^2(1 - X_2)} \right),$$

$$X_2 = B_2 \left(\frac{(1 + X_1)^2}{(1 - X_3)^2} \right),$$

$$X_3 = B_3 \left(\frac{(1 + X_1)^2}{(1 - X_2)(1 - X_3)} \right).$$

$$\begin{aligned}
 X_1 = & \bullet_1 + 3!_1^1 + !_1^2 + 2!_1^3 \\
 & + 9!_1^1 + 3!_1^2 + 6!_1^3 + 2!_2^1 + 2!_2^2 + 4!_1^3 + 2!_3^2 + 2!_3^3 \\
 & + 3^1V_1^1 + 3^1V_1^2 + 6^1V_1^2 + {}^2V_1^2 + 2^2V_1^3 + 3^3V_1^3 + \dots
 \end{aligned}$$

$$\begin{aligned}
 X_2 = & \bullet_2 + 2!_2^1 + !_2^3 \\
 & + 6!_2^1 + 2!_2^2 + 4!_2^3 + 4!_2^1 + 2!_2^2 + 2!_2^3 \\
 & + {}^1V_2^1 + 4^1V_2^3 + 3^3V_2^3 + \dots
 \end{aligned}$$

$$\begin{aligned}
 X_3 = & \bullet_3 + 2!_3^1 + !_3^2 + !_3^3 \\
 & + 6!_3^1 + 2!_3^2 + 4!_3^3 + 2!_2^1 + 2!_2^3 + 2!_3^1 + !_3^2 + !_3^3 \\
 & + {}^1V_3^1 + 2^1V_3^2 + 2^1V_3^3 + {}^2V_3^2 + {}^2V_3^3 + {}^3V_3^3 + \dots
 \end{aligned}$$

Definition

- Let $f_1, \dots, f_n \in K[[h_1, \dots, h_n]] - K$. The combinatorial Dyson-Schwinger systems attached to $f = (f_1, \dots, f_n)$ is:

$$(S) : \begin{cases} X_1 &= B_1^+(f_1(X_1, \dots, X_n)) \\ &\vdots \\ X_n &= B_n^+(f_n(X_1, \dots, X_n)), \end{cases}$$

- Such a system has a unique solution

$$(X_1, \dots, X_n) \in H_R^{\widehat{\{1, \dots, n\}}}.$$

- The subalgebra generated by the homogeneous components of the $X(i)$'s is denoted by $H_{(S)}$.
- If this subalgebra is Hopf, we shall say that the system is Hopf.

Graph associated to (S)

Let (S) be associated to (f_1, \dots, f_n) . The oriented graph associated to (S) is defined by:

- 1 The vertices are $1, \dots, n$.
- 2 There is an edge from i to j if, and only if, $\frac{\partial f_i}{\partial h_j} \neq 0$.

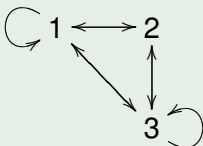

Example coming from QED

$$X_1 = B_1 \left(\frac{(1 + X_1)^3}{(1 - X_3)^2(1 - X_2)} \right),$$

$$X_2 = B_2 \left(\frac{(1 + X_1)^2}{(1 - X_3)^2} \right),$$

$$X_3 = B_3 \left(\frac{(1 + X_1)^2}{(1 - X_2)(1 - X_3)} \right).$$

Graph:

Change of variables

Let (S) be the following system:

$$(S) : \begin{cases} X_1 = B_1^+(f_1(X_1, \dots, X_n)) \\ \vdots \\ X_n = B_n^+(f_n(X_1, \dots, X_n)). \end{cases}$$

If (S) is Hopf, then for all family $(\lambda_1, \dots, \lambda_n)$ of non-zero scalars, this system is Hopf:

$$(S) : \begin{cases} X_1 = B_1^+(f_1(\lambda_1 X_1, \dots, \lambda_n X_n)) \\ \vdots \\ X_n = B_n^+(f_n(\lambda_1 X_1, \dots, \lambda_n X_n)). \end{cases}$$

Concatenation

Let (S) and (S') be the following systems:

$$(S) : \begin{cases} X_1 = B_1^+(f_1(X_1, \dots, X_n)) \\ \vdots \\ X_n = B_n^+(f_n(X_1, \dots, X_n)). \end{cases}$$

$$(S') : \begin{cases} X_1 = B_1^+(g_1(X_1, \dots, X_m)) \\ \vdots \\ X_m = B_m^+(g_m(X_1, \dots, X_m)). \end{cases}$$

Concatenation

The following system is Hopf if, and only if, the (S) and (S') are Hopf:

$$\left\{ \begin{array}{l} X_1 = B_1^+(f_1(X_1, \dots, X_n)) \\ \vdots \\ X_n = B_n^+(f_n(X_1, \dots, X_n)) \\ X_{n+1} = B_{n+1}^+(g_1(X_{n+1}, \dots, X_{n+m})) \\ \vdots \\ X_{n+m} = B_{n+m}^+(g_m(X_{n+1}, \dots, X_{n+m})). \end{array} \right.$$

This property leads to the notion of connected (or indecomposable) system.

Extension

Let (S) be the following system:

$$(S) : \begin{cases} X_1 = B_1^+(f_1(X_1, \dots, X_n)) \\ \vdots \\ X_n = B_n^+(f_n(X_1, \dots, X_n)). \end{cases}$$

Then (S') is an extension of (S) :

$$(S') : \begin{cases} X_1 = B_1^+(f_1(X_1, \dots, X_n)) \\ \vdots \\ X_n = B_n^+(f_n(X_1, \dots, X_n)) \\ X_{n+1} = B_{n+1}^+(1 + a_1 X_1). \end{cases}$$

Iterated extensions

$$(S) : \begin{cases} X_1 = B_1 \left((1 - \beta X_1)^{-\frac{1}{\beta}} \right), \\ X_2 = B_2(1 + X_1), \\ X_3 = B_3(1 + X_1), \\ X_4 = B_4(1 + 2X_2 - X_3), \\ X_5 = B_5(1 + X_4). \end{cases}$$

Dilatation

(S') is a dilatation of (S) :

$$(S) : \begin{cases} X_1 = B_1^+(f(X_1, X_2)), \\ X_2 = B_2^+(g(X_1, X_2)), \end{cases}$$

$$(S') : \begin{cases} X_1 = B_1^+(f(X_1 + X_2 + X_3, X_4 + X_5)), \\ X_2 = B_2^+(f(X_1 + X_2 + X_3, X_4 + X_5)), \\ X_3 = B_3^+(f(X_1 + X_2 + X_3, X_4 + X_5)), \\ X_4 = B_4^+(g(X_1 + X_2 + X_3, X_4 + X_5)), \\ X_5 = B_5^+(g(X_1 + X_2 + X_3, X_4 + X_5)). \end{cases}$$

Fundamental systems

Let $\beta_1, \dots, \beta_k \in K$. The following system is an example of a *fundamental system*:

$$\left\{ \begin{array}{l} X_i = B_i \left((1 - \beta_i X_i) \prod_{j=1}^k (1 - \beta_j X_j)^{-\frac{1+\beta_j}{\beta_j}} \prod_{j=k+1}^n (1 - X_j)^{-1} \right) \\ \quad \text{if } i \leq k, \\ \\ X_i = B_i \left((1 - X_i) \prod_{j=1}^k (1 - \beta_j X_j)^{-\frac{1+\beta_j}{\beta_j}} \prod_{j=k+1}^n (1 - X_j)^{-1} \right) \\ \quad \text{if } i > k. \end{array} \right.$$

Cyclic systems

The following systems are *cyclic*: if $n \geq 2$,

$$\begin{cases} X_1 = B_1^+(1 + X_2), \\ X_2 = B_2^+(1 + X_3), \\ \vdots \\ X_n = B_n^+(1 + X_1). \end{cases}$$

Graph on a cyclic system: an oriented cycle.

Theorem

Let (S) be an SDSE. If it is Hopf, then, for all $i, j \in I$, for all $n \geq 1$, there exists a scalar $\lambda_n^{(i,j)}$ such that for all tree t' , which root is decorated by i :

$$\sum_t n_j(t, t') a_t = \lambda_{|t'|}^{(i,j)} a_{t'},$$

where $n_j(t, t')$ is the number of leaves ℓ of t decorated by j such that the cut of ℓ gives t' .

We shall denote by $a_j^{(i)}$ the coefficient of h_j in f_i and by $a_{j,k}^{(i)}$ the coefficient of $h_j h_k$ in f_i .

Lemma

$\frac{\partial f_i}{\partial h_j} \neq 0$ if, and only if, $a_j^{(i)} \neq 0$.

Theorem

Let us assume that (S) is Hopf. Let us fix i .

- 1 For all path $i = i_1 \rightarrow i_2 \rightarrow \dots \rightarrow i_k$ in the graph of (S)

$$\lambda_k^{(i,j)} = a_j^{(i_k)} + \sum_{p=1}^{k-1} (1 + \delta_{j,i_{p+1}}) \frac{a_{j,i_{p+1}}^{(i_p)}}{a_{i_{p+1}}^{(i_p)}}.$$

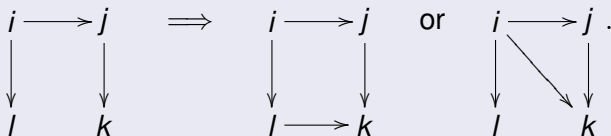

In particular, $\lambda_1^{(i,j)} = a_j^{(i)}$.

- 2 For all $p_1, \dots, p_n \in \mathbb{N}$:

$$a_{(p_1, \dots, p_j+1, \dots, p_n)}^{(i)} = \frac{1}{p_j+1} \left(\lambda_{p_1+\dots+p_{n+1}}^{(i,j)} - \sum_{l \in I} p_l a_j^{(l)} \right) a_{(p_1, \dots, p_n)}^{(i)}.$$

Lemma

Let (S) be a Hopf SDSE. In the graph associated to (S) :

Let us assume that $a_k^{(i)} = 0$. As $a_j^{(i)} \neq 0$, $j \neq k$. As $a_k^{(i)} = 0$,

$$a_j \vee_i^k = a_{j,k}^{(i)} = 0.$$

Then:

$$\lambda_2^{(i,k)} a_j^{(i)} = \lambda_2^{(i,k)} a_{\downarrow_i}^j = a_{\downarrow_i}^k + a_j \vee_i^k = a_j^{(i)} a_k^{(j)} + 0;$$

Hence:

$$\lambda_2^{(i,k)} = a_k^{(j)} \neq 0.$$

Moreover, As $a_l^{(i)} \neq 0, l \neq k$. Then:

$$a_l^{(i)} \lambda_2^{(i,k)} = \lambda_2^{(i,k)} a_l^{(i)} = a_l^{(k)} + a_l^{(i)} a_k^{(l)} = a_l^{(i)} a_k^{(l)} + 0.$$

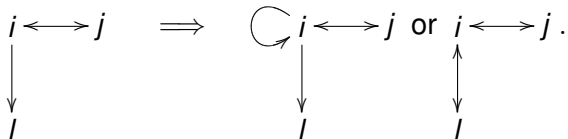

so:

$$\lambda_2^{(i,k)} = a_k^{(l)}.$$

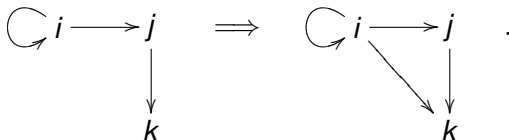

Hence:

$$a_k^{(l)} = a_k^{(j)} \neq 0.$$

- 1 A first special case is given by $i = k$:

- 2 A second special case is given by $i = l$:

Proposition

Let (S) be a Hopf Dyson-Schwinger system with the following graph:

$$1 \longleftrightarrow 2 .$$

Up to a change of variables, two cases can occur:

$$\textcircled{1} (S) : \begin{cases} X_1 = B_1(1 + X_2), \\ X_2 = B_2(1 + X_1). \end{cases}$$

$$\textcircled{2} (S) : \begin{cases} X_1 = B_1((1 - X_2)^{-1}), \\ X_2 = B_2((1 - X_1)^{-1}). \end{cases}$$

We put:

$$f_1(h_2) = \sum_{i=0}^{\infty} a_i h_2^i, \quad f_2(h_1) = \sum_{i=0}^{\infty} b_i h_1^i.$$

Up to a change of variables, assume that $a_1 = b_1 = 1$. Then:

$$\lambda_3^{(1,1)} = \lambda_3^{(1,1)} a_{\downarrow_1^1} = 2a^1 \downarrow_2^1 = 2b_2.$$

On the other hand:

$$2a_2 b_2 = \lambda_3^{(1,1)} a_{\downarrow_1^2} = a \downarrow_1^2 = 2a_2.$$

So $2a_2 b_2 = 2a_2$ and $a_2 = 0$ or $b_2 = 1$. Similarly, $b_2 = 0$ or $a_2 = 1$. Finally:

$$a_2 = b_2 = 0 \text{ or } 1.$$

In the first case, $f_1(h_2) = 1 + h_2$ and $f_2(h_1) = 1 + h_1$. In the second case, consider the path $1 \rightarrow 2 \rightarrow 1 \rightarrow \dots$ of length n .

- If $n = 2k$ is even:

$$\lambda_n^{(1,2)} = 2 + 2(k - 1) = 2k = n.$$

- If $n = 2k + 1$ is odd:

$$\lambda_n^{(1,2)} = 1 + 2k = n.$$

So:

$$\lambda_n^{(1,2)} = n \text{ for all } n \geq 1.$$

Hence, for all $n \geq 1$, $a_{n+1} = a_n$ and finally $f_1(h_2) = (1 - h_2)^{-1}$.
Similarly, $f_2(h_1) = (1 - h_1)^{-1}$.

Main theorem

Let (S) be Hopf combinatorial Dyson-Schwinger system. Then (S) is obtained from the concatenation of fundamental or cyclic systems with the help of a change of variables, a dilatation and a finite number of extensions.

If (S) is a Hopf, the dual of $H_{(S)}$ is the enveloping algebra of a prelie algebra $\mathfrak{g}_{(S)}$.

Description of $\mathfrak{g}_{(S)}$

It has a basis $(e_i(p))_{1 \leq i \leq n, p \geq 1}$. The prelie product is given by:

$$e_i(p) \circ e_j(q) = \lambda_q^{(j,i)} e_j(p+q).$$

As a consequence, $\mathfrak{g}_i = \text{Vect}(e_i(p), p \geq 1)$ is a prelie subalgebra. In the fundamental case, there are three possibilities:

- 1 $i \leq k$, with $\beta_i = -1$. Then $e_i(p) \circ e_i(q) = e_i(p+q)$: \mathfrak{g}_i is an associative, commutative algebra.
- 2 $i > k$. Then $e_i(p) \circ e_i(q) = 0$: \mathfrak{g}_i is a trivial prelie algebra.
- 3 $i \leq k$ and $\beta_i \neq -1$. Then $b_j \neq 0$, and \mathfrak{g}_i is a Faà di Bruno prelie algebra with parameter given by:

$$\lambda_i = \frac{-\beta_i}{1 + \beta_i}.$$

Proposition

Let (S) be a fundamental SDSE. If $k < n$ or if there exists $i \leq k$, such that $\beta_i \neq -1$, then the Lie algebra $\mathfrak{g}_{(S)}$ can be decomposed in a semi-direct product:

$$\mathfrak{g}_{(S)} = (M_1 \oplus \dots \oplus M_k) \rtimes \mathfrak{g}_0,$$

where:

- \mathfrak{g}_0 is a Lie subalgebra of $\mathfrak{g}_{(S)}$, isomorphic to the Faà di Bruno Lie algebra, with basis $(f_n^0)_{n \geq 1}$ such that for all $m, n \geq 1$:

$$[f_m^0, f_n^0] = (n - m)f_{n+m}^0.$$

- For all $1 \leq i \leq k$, M_i is an abelian Lie subalgebra of $\mathfrak{g}_{(S)}$, with basis $(f_n^i)_{n \geq 1}$.

Proposition

- For all $1 \leq i \leq k$, M_i is a left \mathfrak{g}_0 -module in the following way:

$$f_m^0 \cdot f_n^i = n f_{m+n}^i.$$

Proposition

Let (S) be a cyclic SDSE, possibly with dilatations and extensions. The prelie $\mathfrak{g}_{(S)}$ admits a basis $(e_i(k))_{1 \leq i \leq n, k \geq 1}$ such that:

$$e_i(k) \circ e_j(l) = \begin{cases} e_j(k+l) & \text{if there exists a path from } j \text{ to } i \text{ of length } l, \\ 0 & \text{otherwise.} \end{cases}$$

This prelie product is associative.

We now consider systems of the form :

$$(S) : \begin{cases} X_1 &= \sum_{i \in J_1} B_{1,i}^+(f_{1,i}(X_1, \dots, X_n)) \\ &\vdots \\ X_n &= \sum_{i \in J_n} B_{n,i}^+(f_{n,i}(X_1, \dots, X_n)), \end{cases}$$

where for all k, i , $B_{k,i}$ is a 1-cocycle of degree i .

Theorem

We assume that $1 \in J_k$ for all k . Then (S) is entirely determined by $f_{1,1}, \dots, f_{n,1}$.

Fundamental system

$$\left\{ \begin{array}{l} X_i = \sum_{q \in J_i} B_{i,q} \left((1 - \beta_i X_i) \prod_{j=1}^k (1 - \beta_j X_j)^{-\frac{1+\beta_j}{\beta_j} q} \prod_{j=k+1}^n (1 - X_j)^{-q} \right) \\ \text{if } i \leq k, \\ \\ X_i = \sum_{q \in J_i} B_{i,q} \left((1 - X_i) \prod_{j=1}^k (1 - \beta_j X_j)^{-\frac{1+\beta_j}{\beta_j} q} \prod_{j=k+1}^n (1 - X_j)^{-q} \right) \\ \text{if } i > k. \end{array} \right.$$

For example, we choose $n = 3$, $k = 2$, $\beta_1 = -1/3$, $\beta_2 = 1$, $J_1 = \mathbb{N}^*$, $J_2 = J_3 = \{1\}$. After a change of variables $h_1 \rightarrow 3h_1$, we obtain:

$$(S) : \begin{cases} X_1 = \sum_{k \geq 1} B_{1,k} \left(\frac{(1 + X_1)^{1+2k}}{(1 - X_2)^{2k} (1 - X_3)^k} \right), \\ X_2 = B_2 \left(\frac{(1 + X_1)^2}{(1 - X_2)(1 - X_3)} \right), \\ X_3 = B_3 \left(\frac{(1 + X_1)^2}{(1 - X_2)} \right). \end{cases}$$

This is the example of the introduction, with $X_1 = \text{---} \circlearrowright \text{---}$,
 $X_2 = \text{---} \circlearrowleft \text{---}$, $X_3 = \text{---} \circlearrowright \text{---}$.

$$\begin{aligned}
X_1 = & \bullet_{(1,1)} + 3!_{(1;1)}^{(1,1)} + !_{(1,1)}^2 + !_{(1,1)}^3 + \bullet_{(1,2)} + 9!_{(1;1)}^{(1,1)} \\
& + 3!_{(1;1)}^2 + 6!_{(1;1)}^3 + 2!_{(1,1)}^2 + 2!_{(1,1)}^3 + 4!_{(1,1)}^3 + 2!_{(1,1)}^3 + 2!_{(1,1)}^3 \\
& + 3^{(1,1)} \mathbb{V}_{(1,1)}^{(1,1)} + 3^{(1,1)} \mathbb{V}_{(1,1)}^2 + 6^{(1,1)} \mathbb{V}_{(1,1)}^2 + {}^2\mathbb{V}_{(1,1)}^2 + 2^2 \mathbb{V}_{(1,1)}^3 \\
& + 3^3 \mathbb{V}_{(1,1)}^3 + 3!_{(1;2)}^{(1,2)} + 5!_{(1;2)}^{(1,2)} + 2!_{(1,2)}^2 + 4!_{(1,2)}^3 + \bullet_{(1,3)} + \dots
\end{aligned}$$

$$\begin{aligned}
X_2 = & \bullet_2 + 2!_2^{(1,1)} + !_2^3 \\
& + 6!_2^{(1,1)} + 2!_2^2 + 4!_2^3 + 4!_2^{(1,1)} + 2!_2^2 + 2!_2^3 \\
& + {}^{(1,1)}\mathbb{V}_2^{(1,1)} + 4 {}^{(1,1)}\mathbb{V}_2^3 + 3^3 \mathbb{V}_2^3 + 2!_2^{(1,2)} + \dots
\end{aligned}$$

$$\begin{aligned}
X_3 = & \bullet_3 + 2!_3^{(1,1)} + !_3^2 + !_3^3 + 6!_3^{(1,1)} + 2!_3^2 \\
& + 4!_3^3 + 2!_3^{(1,1)} + 2!_3^3 + 2!_3^{(1,1)} + !_3^2 + !_3^3 + {}^{(1,1)}\mathbb{V}_3^{(1,1)} \\
& + 2 {}^{(1,1)}\mathbb{V}_3^2 + 2 {}^{(1,1)}\mathbb{V}_3^3 + {}^2\mathbb{V}_3^2 + {}^2\mathbb{V}_3^3 + {}^3\mathbb{V}_3^3 + 2!_3^{(1,2)} + \dots
\end{aligned}$$

Cyclic systems

$$(S) : \begin{cases} X_{\bar{1}} = \sum_{j \in I_1} B_{1,j} (1 + X_{\overline{1+j}}), \\ \vdots \\ X_{\bar{n}} = \sum_{j \in I_1} B_{n,j} (1 + X_{\overline{n+j}}). \end{cases}$$

$n = 3$:

$$\begin{aligned}
 X_{\bar{1}} &= \bullet_{(\bar{1}, 1)} + \bullet_{(\bar{1}, 2)} + \mathfrak{!}_{\left(\begin{smallmatrix} \bar{2} \\ \bar{1} \end{smallmatrix}; 1 \right)} + \bullet_{(\bar{1}, 3)} + \mathfrak{!}_{\left(\begin{smallmatrix} \bar{3} \\ \bar{1} \end{smallmatrix}; 2 \right)} + \mathfrak{!}_{\left(\begin{smallmatrix} \bar{3} \\ \bar{1} \\ \bar{1} \end{smallmatrix}; 1 \right)}, \\
 X_{\bar{2}} &= \bullet_{(\bar{2}, 1)} + \bullet_{(\bar{2}, 2)} + \mathfrak{!}_{\left(\begin{smallmatrix} \bar{3} \\ \bar{2} \end{smallmatrix}; 1 \right)} + \bullet_{(\bar{2}, 3)} + \mathfrak{!}_{\left(\begin{smallmatrix} \bar{1} \\ \bar{2} \end{smallmatrix}; 1 \right)} + \mathfrak{!}_{\left(\begin{smallmatrix} \bar{1} \\ \bar{3} \\ \bar{2} \end{smallmatrix}; 1 \right)}, \\
 X_{\bar{3}} &= \bullet_{(\bar{3}, 1)} + \bullet_{(\bar{3}, 2)} + \mathfrak{!}_{\left(\begin{smallmatrix} \bar{1} \\ \bar{3} \end{smallmatrix}; 1 \right)} + \bullet_{(\bar{3}, 3)} + \mathfrak{!}_{\left(\begin{smallmatrix} \bar{2} \\ \bar{3} \end{smallmatrix}; 1 \right)} + \mathfrak{!}_{\left(\begin{smallmatrix} \bar{2} \\ \bar{1} \\ \bar{3} \end{smallmatrix}; 1 \right)}.
 \end{aligned}$$
